

E-mail comments from Doug Navetski, King County Stormwater Program, on 8-25-16

- ▷ **Legal requirements** – Include the 2014 Legislative Report on developing funding for OSS programs.
- ▷ **Identification of Risk Areas** – Include a map(s) showing the geographic extent of increased risk areas needing higher level of protection. This will hopefully identify that this is not just a shellfish protection issue, that the risk areas are throughout the county.
- ▷ **Work Group Geographic Priority Recommendations** –
 - Additional streams in unincorporated King County with Fecal TMDLS – Boise Creek, Pussyfoot Creek, Second Creek, Bear Creek, and Evans Creek. Fauntleroy Creek has a Fecal TMDL but is located in Seattle.
 - Other considerations should include the date of installation of the system, if available. The Pre-1979 systems would be especially vulnerable to failure or under-treatment.
- ▷ **Impact of funding (or lack thereof)** – It was mentioned that we should comment on the impact of no additional funding scenario resulting in issues such as increased permit processing times. I think there should be a section outlining the impact the lack of funding has to those programs like education and outreach, technical assistance, responding to failed systems, etc.
